

RC2 — Midra-Verifikation

Vollständige Arbeitsliste: jede Midra-relevante Action, jedes Feedback und jede Variable gegen den Eikos-4K-Simulator geprüft. Kurzfassung: nur die Punkte selbst, ohne die Befundnotizen der abgehakten. RC3 wiederholt denselben Durchgang für Alta/Zenith.

39 / 89

50 OFFEN · 43.8 % GEPRÜFT

1. Known Gaps - decide + verify first

2 / 8

- ☐ **Output Freeze** - not yet enabled for Midra (`actionsToUse` / `feedbacksToUse` / `subscriptionsToUse` in `src/midra/*.ts`).
- ☐ **"LIVE - Screen Freeze" / "LIVE - Layer Freeze"** (the newer LivePremier4-style actions/feedbacks)
- ☐ **Automatic "reset unused Layers to a safe default" cleanup**
- ☐ **"Layer Properties - Cut&Fill" action** - not registered for Midra.
- ☐ **"Layer Properties - Cut&Fill Source" feedback**
- ☐ `canUseMask` **capability guard** - only registered for LivePremier4.
- ☒ **Midra's `INPUT_n` vs. this module's `IN{n}` id convention**
- ☒ **Duplicate `sourceFront` / `sourceBack` option fields** in Midra's `deviceSelectSourceV3` override

2. Explicitly not available on Midra - confirm still cleanly absent

1 / 3

- ☐ **Backup** (Input Backup + Background Set Backup)

☐ **Layer Properties - Keying** - action should not appear at all for a Midra connection.

☒ **Layer Memories**

3. LIVE control

5 / 17 

☐ Recall Screen Memory (Midra's own `deviceScreenMemory` , not the LivePremier4 preset-bank version)

☐ Recall Aux Memory (**Midra/Alta**) - same target-resolution sweep as above.

☐ Recall Master Memory - all Screens variant, per-screen variant.

☐ Recall Multiviewer Memory.

☐ Take / Cut (Screen) - all Screen-targeting modes; confirm "First/Only Selected Screen" resolves correctly (this had a bug on Midra's Cut action historically - retest explicitly).

☒ Set T-Bar Position

☒ Set Transition Time - defaults to Preview; test Both (Preview/Program) too

☒ Screen - Encoder Adjust (T-Bar Position / Transition Time, Raw/Percent/Pixel steps)

☐ Copy Program to Preview.

☐ Lock Screen(s) / Select Preset (Program/Preview) / Select Screen / Select Layer (+ V3 variant)

☐ Input Freeze - Freeze/Unfreeze/Toggle, `IN1` /bare number/ `IN_1` all accepted, `IN{n}.freeze` variable live-updates.

☐ Screen Freeze (Midra's own single-flag implementation)

☐ Layer Freeze (Midra's own single-flag implementation) (**Midra/Alta**)

☐ Source Tally - single screen, `All Screens` , concatenated `S1S2` (AND-across-screens behavior); Both (AND) vs.

☒ Save Screen Memory to Slot

☒ Save/Revert Screen Memory Changes

☐ `SM.nextavailable` variable - confirm it now live-updates correctly on Midra too (this session's subscription-path fix, not yet simulator-tested).

4. Layer Properties

18 / 19 

☒ Position & Size (V3)

☒ Reset Size or Ratio

☒ Source (V3) - verified 2026-09-22. One Source field drives every target; `INPUT_n` confirmed as the real wire id and shown as `IN{n}`; Aux background, Foreground image, Background Set and Color all apply, invalid picks are dropped. Round-trip and Learn confirmed.

☒ Per-Layer variables (`Sx.{pgm|prw}.layerY.*` , `.layerbg` , `.layerfg`)

☒ Transitions - verified 2026-09-22 on numbered layers, Background and Foreground.

☒ Opacity (verified 2026-09-22: numbered layers, Background and Foreground) + Encoder Adjust

☒ Aspect & Crop

☒ Mask - verified 2026-09-22 on all three layer kinds, pixels and percent.

☒ Border - verified 2026-09-22 on numbered layers.

☒ Effects (Filter/Transform)

☒ ~~Strobe~~ - confirmed not applicable to Midra (2026-09-22): the feature does not exist on the platform at all, so this is not a firmware gate but a permanent absence, and the field is hidden via a constant rather than a firmware comparison. If Analog Way ever adds it, it will show up in their release notes and the constant can be flipped then.

☒ Speed - verified 2026-09-22. Pt1/Pt2 work on all three layer kinds.

☒ Timing - verified 2026-09-22. Needed a fix first: the ms-to-raw conversion reads the screen's transition time, and did so the LivePremier way (screen group keyed by 'S1', presetUp/presetDown, takeUpTime/takeDownTime).

- ☒ "Toggle" choice on every on/off flag
-
- ☒ Property Status feedback
-
- ☒ Layer Source feedback
-
- ☒ Global Anchor Point feedback - removed for Midra (2026-09-22): confirmed in the protocol that its REMOTE snapshot has no live/screens/layers node and no anchorPoint anywhere, so the feedback could only ever report CENTER for a setting the device does not have. Nothing to test.
-
- ☐ Cut&Fill action/feedback - see Known Gaps above, not yet registered.
-
- ☒ Keying (per Layer)
-

5. Multiviewer

0 / 4 

- ☐ Recall Multiviewer Memory (also listed under LIVE above - just the one action).
-
- ☐ Select Source in Widget.
-
- ☐ Widget Selection feedback.
-
- ☐ Multiviewer output variables (`MVW{n}.*`)
-

6. Timers

1 / 3 

- ☐ Timer Setup / Adjust Time / Transport.
-
- ☐ Timer State feedback.
-
- ☒ `TIMER{n}.value / .hms / .h / .m / .s` variables
-

7. Audio

0 / 5 

- ☐ Route (Channels) / Route (Block) - block size cap/clamp behavior at output-module boundaries.
-

- ☐ Audio Routing Status / Block Routing Status feedbacks.

- ☐ Dante Functions - Reboot/Factory Reset only (renaming is known broken everywhere, not Midra-specific)

- ☐ Stream Control (Midra/Alta).

- ☐ Mute Stream (Midra/Alta) + Stream Running State feedback (Midra/Alta) + Stream Audio Mute Status feedback (Midra/Alta).

8. Preconfig

2 / 4 

- ☒ Set Input Plug + its feedback

- ☒ Inputs - Set Input Keying + Input Keying Status feedback

- ☐ Assign Image from Library to Foreground/Background Frame (Midra/Alta)

- ☐ ~~Set Background~~ ~~Set Source~~ / ~~Background~~ ~~Set Source~~ ~~Status~~

9. Device-level

0 / 12 

- ☐ Set Testpattern (Midra 4K naming) - Screen Canvas + Output groups, Area/Raw Colors/Color options, Grid Custom/Crosshatch/Checkerboard pattern-specific fields, Pathological pattern, 30bit Testpattern #1/#2.

- ☐ Testpattern Active feedback (Midra 4K) - matching coverage.

- ☐ Raster Box action/feedback - confirm intentionally unavailable on Midra (models patterns as two booleans instead of one array, per existing notes) rather than silently broken.

- ☐ GPIO (GPO/GPI State) - confirm current registration status; the base `deviceGpioOut` / `deviceGpioIn` feedbacks are commented out in `feedbacksToUse` (line 55-56)

- ☐ Power (Wake-on-LAN etc.).

- ☐ Sync Selection.

- ☐ Failover to Hot Backup - swap over, swap back, 30s cooldown; confirm the mirrored command set (Recall/Take/Cut/Preset/lock/selection) actually applies cleanly to a second Midra simulator instance if one is available, otherwise test the config/UI path as far as possible.

- ☐ Show Thumbnail feedback - Input/Output/Image Store/Timer sources, refresh rate, throttling under many active thumbnails.

- ☐ Generic device variables (`Device.Series` should read "Midra 4K", `Device.Model` , `Device.Name` , `Device.Status.Temperature` , `Device.Status.Fans` , `Device.FirmwareVersion` , `Device.FirmwareGeneration`).

- ☐ Health Alarm feedback / Input Signal Present / Layer Signal Present feedbacks.

- ☐ Connection Status feedback - Main Device states; Hot Backup Device state once configured.

- ☐ Custom Commands (raw get/replace).

9b. Aux screens

9 / 9

- ☒ Transition state comes from the Aux's own node.

- ☒ Background source reads the right property.

- ☒ An Aux no longer claims a numbered layer, a Foreground or a memory.

- ☒ `A{n}.width` / `.height` / `.aspectratio` come from the output the Aux feeds (no canvas node of its own).

- ☒ Screen/Aux labels read the device's own name.

- ☒ Enabling/disabling a Screen or Aux in the preconfig updates the variables live (`S1+A1` / `S1+S2` / `S1` with two outputs on an Eikos).

- ☒ Aux background accepts a Screen's Program (`PROGRAM_{n}` , listed as `S1 PGM`) and a colour.

- ☒ `OUT{n}.usedin` reports the Screen or Aux each output feeds.

- ☒ **Resolved 2026-09-22:** Aux Memories are entirely real

-
- ☐ **sortName ordering** - action/feedback picker groups appear in the documented order (LIVE → Multiviewer → Layer Properties → Timers → Audio → Preconfig → Device → Custom Commands) with nothing missing or duplicated for Midra's specific action set.
-
- ☐ **Dynamic dropdowns** (Screens, Inputs, Layers, Images, Memories, Timers, Outputs) behave correctly while disconnected and immediately after connecting to the simulator
-
- ☒ **Platform constants** match the real device (2026-09-22, Eikos 4K simulator state): Inputs 16, Screen Memories 200, Master Memories 50, Multiviewer Memories 20, Stills 50, Timers 3
-
- ☐ **Expression Mode / local variables** work on every option field that should support them (spot-check a handful across different action families, not just Layer Properties).
-
- ☐ **"(Midra/Alta)" name suffixes** - once everything above is confirmed working, this is the point where those suffixes get removed from the Midra-tested items (leave Alta-only-relevant uncertainty in place until RC3, if the code truly can't tell them apart yet).
-
